```
AMENDMENTS TO THE CLAIMS
В.
```

(currently amended) A computer implemented method for 1. handling a plurality of filters, said method comprising: receiving first event data corresponding to a first filter from the plurality of filters, the first filter including first filtering properties; receiving second event data corresponding to a second filter from the plurality of filters, the second filter including second filtering properties; determining whether to change filtering properties of at least one of the plurality of filters using the first event data and the second event data; and changing the filtering properties of at least one of the plurality of filters in response to the determination; assigning first filtering properties to the second filter; and

VANLEEUWEN & VANLEEUWEN

assigning second filtering properties to the first filter.

2. (canceled)

(currently amended) The method of claim 1 further 3. domprising: detecting whether to reconfigure the first filter in response to the analyzing the first event data and the second event data, the reconfiguring including adjusting the first filtering properties; and reconfiguring the first filter in response to the detecting.

Docket No. RSW920030155US1

Page 2 of 14 Jager, et. al. - 10/717,678

P.06/17

**PATENT** 

- 4. (original) The method of claim 1 further comprising:
  identifying whether to configure the first filter as an
  exception filter, the exception filter configuring
  including portions of the first filter properties and
  portions of the second filter properties; and
  configuring the first filter as the exception filter in
  response to the identifying.
- 5. (original) The method of claim 1 further comprising: retrieving historical trend data; and configuring the first filter and the second filter corresponding to the historical trend data.
- 6. (original) The method of claim 5 wherein the historical trend data is based upon a timeline, and wherein the timeline is selected from a group consisting of a time of day, a time of month, and a time of year.
- 7. (original) The method of claim 1 wherein the determining further comprises:
  identifying an event type with a highest occurrence number using the first event data and the second event data; and comparing the identified event type with the first filtering properties.
- 8. (original) An information handling system comprising: one or more processors; a memory accessible by the processors; one or more monitor points;

Docket No. RSW920030155US1

Page 3 of 14 Jager, et. al. - 10/717,678

a plurality of filters;

ohe or more nonvolatile storage devices accessible by the processors; and

a filter handling tool for dynamically managing the plurality of filters, the filter handling tool including software code effective to:

receive first event data from one of the monitor points corresponding to a first filter from the plurality of filters, the first filter including first filtering properties;

receive second event data from one of the monitor points corresponding to a second filter from the plurality of filters, the second filter including second filtering properties;

determine whether to change filtering properties of at least one of the plurality of filters using the first event data and the second event data; and

change the filtering properties of at least one of the plurality of filters in response to the determination.

9. (original) The information handling system of claim 8
wherein the software code is further effective to:
assign first filtering properties to the second filter; and
assign second filtering properties to the first filter.

Docket No. RSW920030155US1

Page 4 of 14 Jager, et. al. - 10/717,678

SEP-13-2005 15:08

**PATENT** 

- 10. (original) The information handling system of claim 8 wherein the software code is further effective to: identify whether to configure the first filter as an exception filter, the exception filter configuring including portions of the first filter properties and portions of the second filter properties; and configure the first filter as the exception filter in response to the identifying.
- 11. (briginal) The information handling system of claim 8
  wherein the software code is further effective to:
  retrieve historical trend data from one of the nonvolatile
  storage devices; and
  configure the first filter and the second filter
  corresponding to the historical trend data.
- 12. (original) The information handling system of claim 11 wherein the historical trend data is based upon a timeline, and wherein the timeline is selected from a group consisting of a time of day, a time of month, and a time of year.
- 13. (original) The information handling system of claim 8
  wherein the software code is further effective to:
  identify an event type with a highest occurrence number
  using the first event data and the second event data; and
  compare the identified event type with the first filtering
  properties.

Docket No. RSW920030155US1

Page 5 of 14 Jager, et. al. - 10/717,678

```
14.
     (currently amended) A computer program product stored on a
    computer operable media for dynamically handling a
     plurality of filters, said computer program product
     comprising software code effective to:
     receive first event data corresponding to a first filter
     from the plurality of filters, the first filter including
     first filtering properties;
     receive second event data corresponding to a second filter
     from the plurality of filters, the second filter including
     second filtering properties;
     determine whether to change filtering properties of at
     least one of the plurality of filters using the first event
     data and the second event data; and
     change the filtering properties of at least one of the
     plurality of filters in response to the determination;
     assign first filtering properties to the second filter; and
     assign second filtering properties to the first filter.
```

- 15. (canceled)
- 16. (currently amended) The computer program product of claim
  14 wherein the software code is further effective to:
  detect whether to reconfigure the first filter in response
  to the analyzing the first event data and the second event
  data, the reconfiguring including adjusting the first
  filtering properties; and
  reconfigure the first filter in response to the detecting.

Docket No. RSW920030155US1

Page 6 of 14 Jager, et. al. - 10/717,678

P.10/17

- 17. (briginal) The computer program product of claim 14 wherein the software code is further effective to: identify whether to configure the first filter as an exception filter, the exception filter configuring including portions of the first filter properties and portions of the second filter properties; and configure the first filter as the exception filter in response to the identifying.
- 18. (priginal) The computer program product of claim 14 wherein the software code is further effective to: retrieve historical trend data; and configure the first filter and the second filter corresponding to the historical trend data.
- 19. (original) The computer program product as described in claim 18 wherein the historical trend data is based upon a timeline, and wherein the timeline is selected from a group consisting of a time of day, a time of month, and a time of year.
- 20. (original) The computer program product as described in dlaim 14 wherein the software code is further effective to: identify an event type with a highest occurrence number using the first event data and the second event data; and compare the identified event type with the first filtering properties.
- (original) A computer implemented method for handling a 21. plurality of filters, said method comprising:

Docket No. RSW920030155US1

Page 7 of 14

```
receiving first event data corresponding to a first filter from the plurality of filters, the first filter including first filtering properties;
```

receiving second event data corresponding to a second filter from the plurality of filters, the second filter including second filtering properties;

determining whether to change filtering properties of at least one of the plurality of filters using the first event data and the second event data; and

changing the filtering properties of at least one of the plurality of filters in response to the determination, wherein the changing further comprises:

assigning first filtering properties to the second filter; and

assigning second filtering properties to the first filter.

22. (original) A computer implemented method for handling a plurality of filters, said method comprising:
retrieving historical trend data, wherein the historical trend data is based upon a timeline, and wherein the timeline is selected from a group consisting of a time of day, a time of month, and a time of year;
pre-configuring a first filter and a second filter corresponding to the historical trend data;
receiving first event data corresponding to the first filter from the plurality of filters, the first filter

Docket No. RSW920030155US1

Page 8 of 14 Jager, et. al. - 10/717,678 Atty Ref. No. R321

including first filtering properties;

receiving second event data corresponding to the second filter from the plurality of filters, the second filter including second filtering properties;

determining whether to change filtering properties of at least one of the plurality of filters using the first event data and the second event data; and

changing the filtering properties of at least one of the plurality of filters in response to the determination.

- 23. (original) An information handling system comprising: one or more processors;
  - a memory accessible by the processors;
  - one or more monitor points;
  - a plurality of filters;
  - one or more nonvolatile storage devices accessible by the processors; and
  - a filter handling tool for dynamically managing the plurality of filters, the filter handling tool comprising software code effective to:

receive first event data from one of the monitor points corresponding to a first filter from the plurality of filters, the first filter including first filtering properties;

receive second event data from one of the monitor points corresponding to a second filter from the plurality of filters, the second filter including second filtering properties;

Docket No. RSW920030155US1

P.13/17

PATENT

determine whether to change filtering properties of at least one of the plurality of filters using the first event data and the second event data; and

VANLEEUWEN & VANLEEUWEN

change the filtering properties of at least one of the plurality of filters in response to the determination, wherein the changing further comprises:

> assign first filtering properties to the second filter; and

assign second filtering properties to the first filter.

(original) A computer program product stored on a computer 24. operable media for dynamically handling a plurality of filters, said computer program product comprising software code effective to:

receive first event data corresponding to a first filter firom the plurality of filters, the first filter including first filtering properties;

receive second event data corresponding to a second filter from the plurality of filters, the second filter including second filtering properties;

determine whether to change filtering properties of at least one of the plurality of filters using the first event data and the second event data; and

change the filtering properties of at least one of the plurality of filters in response to the determination, wherein the software code is further effective to:

Docket No. RSW920030155US1

Page 10 of 14 Jager, et. al. - 10/717,678

assign first filtering properties to the second filter; and

assign second filtering properties to the first filter.

Docket No. RSW920030155US1
